PROPOSITION MOHAMAD FERAS M.BURHAN AL_SAKKA OF THE STERILITY

MOHAMAD FERAS M.BURHAN AL-SAKKA

Summary with the keywords:

Chromosomes and their functions: they responsible about the cell and its active, it is as the brain for the cell which control everything related with the cell and cell does not disobey its orders. For example, chromosomes order the cell to secrete insulin, which is a protein responsible to organize the sugar level in blood. Chromosomes are also responsible for the secretion of the estrogen and the hormone fairy, and others, which responsible for the bones construction and others make the soft slimy substances. The ability of the chromosomes came from it's measured by micron although its mini and very accuracy. This ability have all the secrets of creating, all secrets of female, the secrets of genomic, and the secrets of the cell. All the secrets which discovered by modern medicine by modern technology and medical engineering is considered as very little part from many secrets which are still not discovered in each human body cell until now and each cell have secret does not share with other cells. All these secrets and genomic qualities are moving from one generation to other, by parents to children all of them with codes, secrets and special cods related with these chromosomes.
